康高特-MEGGER PAM410相角测试仪 DESCRIPTION

The PAM410 is specifically designed for measurements on electrical power systems. It is capable of displaying the phase angle relationship between two power signals, which can be two currents, two voltages or any combination. Currents up to 25 A and voltages up to 500 V can be applied directly to the instrument. The current input range can be extended by using external current transformers.

PAM410 APPLICATION

The PAM410 is suitable for checking polyphase metering installations, testing protective relays, make comparative test in electrical substations, and verifying the phase angle deviation on power transformers.

康高特-MEGGER PAM410相角测试仪 FEATURES AND BENEFITS

- Direct digital reading down to tenths of a degree (0.1°) – does not require calculation or interpretation.
- Designed for use in substation or industrial environments – transport case provided for rugged protection.
- Phase angle calculated from of any combination of two power signals to be measured giving broad application capability. Local calibration.
- Switchable inputs between current and voltage –allows phase angle of any combination of two power signals to be measured giving broad application capability.
- Local calibration.
